

Silicon and Adhesive Remover - Directions for use:

As a rule of thumb, products that do not harden can be removed.

- **Removable: Most caulks, contact adhesives, labels, decals, tape residue, gum, sap, tar, can be removed with Silicon and Adhesive Remover .**
- **Will not remove: hardened products such as Super Glue, two part epoxies, urethane floor coatings and varnishes cannot be removed.**

Caulking

For silicone, polyurethane, and polysulfide caulks, first cut away any excess caulking then work Silicon and Adhesive Remover from the edge(s) of the bond with a putty knife or scraper.

Silicon and Adhesive Remover will work its way under the caulk and release the bond. If residue remains, simply re-spray the area and wipe it clean with a terry type cloth.

If you spray an area by mistake, either wipe it dry or let the Silicon and Adhesive Remover evaporate, the caulking will not be affected.

If caulk has not set up, just apply Silicon and Adhesive Remover to the contaminated area and the caulk will start to emulsify, then wipe with clean dry cloth. You may have to repeat this step if the caulk you are using contains a dye or carbon black and is on fabric or carpet. Repeat this step till all dye or coloration is removed.

Contact Cement/Glue

Coat the area with Silicon and Adhesive Remover and let it sit. The longer it remains on the adhesive the easier your job becomes. Then wipe the area with a clean cloth.

If any residue remains, repeat the first step. When using Silicon and Adhesive Remover to remove carpet or headliners, spray the surface heavily, wait at least 15 minutes and test a portion of the item to be removed. If the item remains secure, re-apply Silicon and Adhesive Remover and wait an additional 15 minutes before removing the item.

Polyurethane Expanding Foams

Spray the contaminated area with the Silicon and Adhesive Remover before the foam dries and wipe the area with a clean cloth.

Note once the foam has cured the Silicon and Adhesive Remover will not remove the residue.

Tape/Labels/Stickers/Decals/Pin stripping

First, spray the item to be removed and let sit for a minute.

You will notice that Silicon and Adhesive Remover penetrates from the edges inward.

Use a sharp object to work the edges and re-apply Silicon and Adhesive Remover .

Once there is enough material to grab, slowly begin pulling the item away from the adhesive while spraying Silicon and Adhesive Remover on the back of the item. It should pull away with ease.

Gum

To remove gum from carpets, clothing or fabric, just spray with Silicon and Adhesive Remover, wait a minute, and rub the area with your fingers or a stiff nylon brush.

Sap/Tar/Grease

All of the above will readily dissolve in Silicon and Adhesive Remover, just spray, wait, and wipe
